Shlomi Ben Haim  
Co-Founder and CEO  
JFrog  

How would the rise of DevOps change the future of computer science education?  
You know, DevOps changed the landscape and especially when you look at developers today. There's no java developers, there's no .NET developers, there's full stack developers. All of them are powered by machine. Everybody wants to release faster, everyone wants to be more secure, and therefore if you don't know how to combine the power of developers with the power of the machine, which is DevOps, you will fall behind. And you see the Yale, the Stanford, the MIT universities already practicing DevOps on year three; fortunately enough for us using JFrog, so I think in the next generation it will just be part of the practice.
